Not illustrated. 1875 Excerpt: .is not possible, an easy graphical multiplication of the segments by the square of the ratio of the spans will give the moments. We see also the reason why, for four symmetrical spans, the second and not the first must be taken as the standard span. If the construction of the moments over the supports is our sole purpose, as is in practice the case, the polygon need not be drawn. We have only to find our fixed points, and note the intersection of the sides with the verticals through the supports, without drawing the sides themselves. In the preceding Artswe have purposely considered only the particular case of uniform loading, and have taken only three spans, in order to familiarize the reader with the nature of the problem and the method of its solution. In ofder to attain a clear understanding of the subject as thus far developed, he would do well to take some particular for instance, that of a girder of two or three or four spans of given length, the end spans being equal, and intermediate spans equal and say one-fourth longer than the ends, and work out by diagram the moments at the supports for a uniform load over the whole length of girder. For two spans the moment at the centre support should be  $p P, l$  being the length of span, the load per unit of length. For three spans the moment at the two inner supports is 1...
